Dream House A-Frame Project Report

1. Design Choices

The project was designed using A-Frame to create an interactive 3D virtual environment. The villa model serves as the main structure, while additional elements like the pool, garage, and gate enhance realism. Textures were applied to the ground and sky to simulate a real outdoor environment.

2. Technical Challenges and Solutions

A key challenge was the pool, which initially appear to be in the sky. This was fixed by changing the position. Another issue was overlapping objects such as the garage and swimming pool. This was resolved by adjusting their positions in the scene. Integrating external 3D models required proper asset management and correct file paths.

3. Future Improvements

Future improvements include adding automatic gate interaction, lighting effects, and more realistic textures. Additional features like animated objects and sound effects would improve immersion. Performance optimization will also be considered.
